

CONFIDENTIAL DOSSIER

Subject: Fluoride in Drinking Water - Sedation via Mineralization?

Fluoridation was introduced globally under the pretext of reducing dental caries. However, an increasing number of studies suggest a suspicious correlation between high fluoride intake and decreased cognitive function—particularly in developing children.

While mainstream institutions deny any adverse effects, internal murmurs tell a different story. In ██████, a document titled "Cognitive Dampening Initiative" allegedly surfaced from within the Ministry of Health. Though it was swiftly retracted and erased from official channels, various mirrored versions made fleeting appearances on obscure FTP servers before vanishing completely.

Although no formal acknowledgment exists, certain signed agreements—heavily redacted in available leaks—suggest possible non-disclosure arrangements between public health authorities and global additive suppliers.

The substance in question continues to be added to municipal water supplies, under the guise of "public benefit." Yet, questions remain unanswered, documents remain sealed, and effects remain... subtle.
